ISSUE #9  
Special Feature

## Connecting with the World

**RADIANT** is Ritsumeikan University's online Research Report. It puts the spotlight on some of

Ritsumeikan's top-tier researchers, and is one of the best ways to get a taste of the variety of research going on at Ritsumeikan in an easy to view format. Check it out!

ISSUE #9

## Connecting with the World

March 2019

We now live in a borderless age where all things transcend national boundaries.  
Researchers search for new insights around the world to tackle global issues.

The researchers at Ritsumeikan also apply a world-embracing perspective in their fieldwork and studies, whether domestic or abroad, considering the entire planet as their research field.  
Through their findings, they aim to contribute to the betterment of humankind.

In this issue, our researchers, along with scientists from around the world involved in solving advanced, universal challenges that face humanity today, will share the appeal of connecting across borders to engage with diverse cultures while advancing their studies.

STORY #3

### Low-cost, high-efficiency, next-generation Thin-film Solar Cell to replace Silicon

Jakapan Chantana  
Professor, Research Organization of Science and Technology

What would the structure of a thin-film solar cell that does not use harmful cadmium and yet achieves high photoelectric conversion efficiency look like?

Today, as the number of energy-related problems, such as environmental pollution, the exhaustion of underground resources, natural disasters, and nuclear power plant accidents increases, renewable energy is becoming increasingly more important. In particular, expectations are high for solar power, but much development must take place before it can surpass existing power generation methods. Solar cells made from silicon currently have a market share of more than 90%, but there is a limit to the reductions in manufacturing costs that can be achieved; thus, significant efforts are being devoted to develop new types of solar cells that do not require silicon.

One such new kind of solar cell is the CIS thin-film solar cell, which mainly consists of copper (Cu), indium (In), and selenium (Se), with a chalcopyrite crystalline structure.

Jakapan Chantana is engaged in the development of solar cells that use Cu, In, Se, gallium (Ga), and sulfur (S), instead of silicon, for optical absorption.

CIS solar cells are characterized by their capacity to absorb about 100 times more light than silicon-based cells. They can also be made into thin films. The cell thickness of silicon solar cells is about 200  $\mu$ m, while
